Control deinterlacing by the Wowza Streaming Engine Transcoder

This article describes how to control the way the Transcoder in Wowza Streaming Engine™ media server software deinterlaces incoming video.

To control how Transcoder deinterlaces incoming video, add the following parameter to the **Decode/Video/Parameters** section in your Transcoder template:

```
      deinterlace
      Long
```

Possible values are:

- **256** – field interpolation top
- **768** – field interpolation bottom
- **512** – vertical smoothing

Add **2048** to the above value to reorder fields.

For example, to turn on field interpolation bottom with field reordering use the following:

```
      deinterlace
      2816
      Long
```
